8 Debugging and Functional Programming (16 points)

Consider these OCaml programs that do not type-check and their corresponding error messages (including the implicated code, shown <u>underlined</u>). Each has comments detailing what the program should do as well as sample invocations that should type-check.

```
(* "wwhile (f, x)" returns x' where there exist
    values v_0, ..., v_n such that:
    - x is equal to \mathtt{v}_0
    - x' is equal to \mathbf{v}_n
    - for each i between 0 and n-2, we have
         (f v_i) equals (v_{i+1}, true)
    - (f v_{n-1}) equals (v_n, false) *)
let f x =
    let xx = x * x in
    (xx, (xx < 100))
let rec wwhile (f,b) =
    match f with
    \mid (z, false) -> z
    | (z, true) \rightarrow wwhile (f, z)
assert( wwhile (f, 2) = 256 );;
This expression has type
    int -> int * bool
but an expression was expected of type
    'a * bool
```

- (a) [2 pts] Why is the sumList program not well-typed?
- (b) [2 pts] Fix the sumList program.
- (c) [2 pts] Why is the wwhile program not well-typed?
- (d) /2 pts/ Fix the wwhile program.

Consider an *execution trace* that shows a high-level overview of a program execution focusing on function calls. For example, the trace on the right tells us that:

- i. We start off with fac 1.
- ii. After performing some computation, we have the expression 1* fac 0. The 1 * is grayed out, indicating that fac 0 is the next expression to be evaluated.
- iii. When we return from fac 0, we are left with 1 * true, indicating a program error: we cannot multiply an int with a bool.

```
(* "append xs ys" returns a list containing the
    elements of "xs" followed by the elements of "ys" *)
let rec append xs ys =
    match xs with
    | [] -> ys
    | h::t -> h :: t :: ys

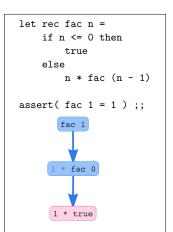

assert( append [1] [2] = [1;2] ) ;;

Error encountered because
    int
is incompatible with
    int list

append [1] [2]

1 :: ([] :: [2])
```

- (e) /2 pts/ Why is the append program not well-typed?
- (f) /2 pts/ Fix the append program.

```
(* "digitsOfInt n" returns "[]" if "n" is
    not positive, and otherwise returns the
    list of digits of "n" in the order in
    which they appear in "n". *)
let rec append x xs =
    match xs with
    | [] -> [x]
    _ -> <u>x :: xs</u>
let rec digitsOfInt n =
    if n \le 0 then
       []
    else
       append (digitsOfInt (n/10))
               [n mod 10]
assert( digitsOfInt 99 = [9;9] ) ;;
Error encountered because
    'a list
is incompatible with
               digitsOfInt 99
           append (digitsOfInt 9)
  append (append (digitsOfInt 0)
[n_1 mod 10]) [n mod 10]
  append (append
                  []
[n_1 mod 10]) [n mod 10]
           append (append [] [9])
[n mod 10]
       append ([] :: [9]) [n mod 10]
```

- (g) [2 pts] Why is the digitsOfInt program not well-typed?
- (h) [2 pts] Fix the digitsOfInt program.
